Make this

ChatGPT

I see the two CS1 documents you uploaded:

1. **Final Project: Pick a Project** — Your idea for a website that matches college students with compatible roommates or study partners.
2. **Tech Debt** — Your assignment about improving Python variable names and making code easier to understand.

Do you want me to **build the actual roommate-matching website in Python using Drafter**, finish the worksheets, or do both?

You

build the actual roommate-matching website in Python using Drafter

Worked for 1m 46s

ChatGPT

together. — College Roommate & Study Partner Matcher

Your website will follow the idea from your final project worksheet: a clean, simple app that helps college students find compatible roommates or study partners.

The first version will have three pages:

Take your curiosity further
Scan to get the ChatGPT app

1. Welcome page

Introduces the website and lets students get started.

2. Create your profile

Enter your name, sleep habits, cleanliness, noise preferences, guest preferences, and a short bio.

3. Your matches

See compatible students ranked by percentage, along with reasons for each match.

It will use Python dataclasses, lists, loops, `if` statements, functions, and Drafter routes. The initial profiles will be fictional example students, so you can demonstrate the application without needing a real database.

Your Python website is ready

Download together.py ↗

I created the complete Python file, including seven fictional student profiles and the matching algorithm.

How to run it on your Mac

1. Download `together.py`.
2. Open Terminal and go to the folder containing the file.
3. Install Drafter if you haven't already:

```
python3 -m pip install drafter
```

4. Start your website:

Take your curiosity further
Scan to get the ChatGPT app

```
python3 together.py
```

5. Open the local website address that appears in Terminal.

How the matching works

Each matching preference earns one point. The total becomes a percentage.

For example, if two students agree on five of six preferences, their compatibility score is **83%**.

The code has passed Python syntax checks and basic logic tests. I haven't verified it in a running Drafter browser, so you should test the actual pages after launching it.

Important: This is a working project prototype, not a live student network. Profiles are fictional, and information isn't saved to a permanent database.

Since this is your CS1 final project, I recommend reading through `match_reasons()`, `compatibility()`, and `find_matches()` carefully. Those are the main functions you'll want to understand and be able to explain to your instructor.

The implementation follows the documented Drafter framework ↗.

ChatGPT

I've updated the **Your Best Matches** section in `together.py` to follow the layout in your uploaded `campus_match.py`.

Download updated together.py ↗

Preview of the results page

Your Best Matches

Students ranked by compatibility with your preferences.

Your Profile

Name: User

Looking for: Roommate

1. Alex 100% compatible

Roommate

I like a peaceful room and keeping shared spaces clean.

Why you match

- Same sleep schedule
- Same cleanliness preference
- Same noise preference
- Same guest preference
- Same smoking preference
- Same study style

2. Taylor 100% compatible

Take your curiosity further
Scan to get the ChatGPT app

Roommate

I like early mornings, books, and a calm space.

Why you match

- Same sleep schedule
- Same cleanliness preference
- Same noise preference
- Same guest preference
- Same smoking preference
- Same study style

Illustrative layout. The actual Drafter page uses headings, text, lists, and dividers.

The updated code includes ranking numbers, percentages, student bios, shared-trait explanations, and navigation buttons.

I checked that the Python syntax is valid and that the matching algorithm ranks profiles correctly. I haven't tested the visual appearance in a running Drafter browser.

To use it: Replace your previous `together.py` with the updated file and run it again.

together.py
Code

You

Resend and change the name to Campus Match together

ChatGPT

Renamed successfully!

Your website is now called **Campus Match together**.

Take your curiosity further

Roommate Match...
PDF

Let's fix the UI kind of like this:

Worked for 2m 14s

ChatGPT

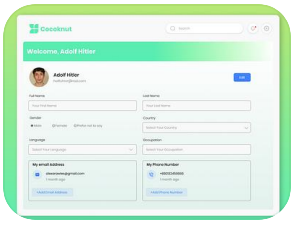

I've redesigned **Campus Match together** to closely follow your uploaded Roommate Matcher mockup, while keeping it built in Python using Drafter.

Download the updated Campus Match together.py ↗

One Python file — the styling is included, so you don't need a separate CSS file.

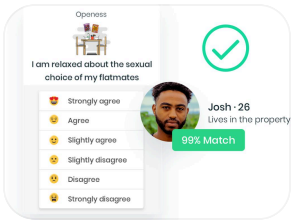

Take your curiosity further
Scan to get the ChatGPT app

What's changed

Profile page

Clean white form, two-column dropdowns, green button, and clearly labeled preferences.

Best Matches page

Individual cards showing a circular compatibility percentage, student name, bio, and green tags explaining why you match.

I also added navigation for **Home, Create Profile, All Profiles, and How Scoring Works**, like your mockup.

The compatibility scores are calculated from six preferences, rather than using the example percentages in the PDF. I verified that the Python syntax is valid and tested the matching calculations. The browser appearance still needs to be checked in Drafter.

Run it on your Mac

Save the new file in your project folder, then run:

```
python3 campus_match_together.py
```

The project still uses CS1-friendly Python: dataclasses, loops, lists, conditionals, and Drafter routes.

Next improvement I'd recommend: Make the profile page remember the answers when editing, and make the match cards show both similarities and important differences. That would make the compatibility scores more useful.

campus_match_together.py
Code

You

I got feedback from a TA; he suggested that once you make your profile, it should save so you don't need to keep re-adding your information every time you get out of the screen. Also, I think each profile should save so you can match with a person who just made a profile. (but I should have the option to delete a profile if needed)

Stopped thinking

You

Let me be clearer: they can only make a profile on one device (this device), but have their profile join the list of other profiles after being created.

Worked for 1m 45s

ChatGPT

Got it! **Campus Match together** will work on one computer, with everyone who creates a profile joining the same saved list.

I've updated the Python application to do exactly that.

Download updated Campus Match together.py ↗

Includes permanent local profile storage, editing, deleting, and compatibility matching.

How it works now

1. **Create a profile.** Enter your habits, preferences, and bio.
2. **Automatically save it.** Your profile joins the list of students.

Take your curiosity further
Scan to get the ChatGPT app

3. **See your matches.** The app compares your answers with every other saved profile.
4. **Come back later.** Your information remains saved even after restarting the app.
5. **Manage profiles.** Select an existing profile, edit it, or permanently delete it after confirmation.

Where is everything saved?

The program automatically creates a file called `campus_match_profiles.json` in the same folder as your Python program.

You don't need to create that file yourself.

Your project folder

`campus_match_together.py`

`campus_match_profiles.json` — created automatically

Important: Profiles are shared within this local application, not across separate computers. Anyone using the app on that computer can select and manage its saved profiles, so this is appropriate for your CS1 prototype, not for storing private student information.

I tested saving, reloading, matching, editing, switching, and deleting profiles using a simulated Drafter environment. The actual browser interface still needs testing.

Your project is now much closer to a complete final project because it has **persistent data**, not just temporary information in `State`.

campus_match_together.py
Code

You

resend it

Take your curiosity further
Scan to get the ChatGPT app

ChatGPT

Download Campus Match together.py ↗

This is your latest version, including:

- Saved profiles that remain after restarting
- Automatic addition of new profiles
- Edit and delete profile options
- Compatibility scores and ranked matches
- Updated UI based on your mockup

The Python file has been verified and passes the syntax check.

campus_match_together.py
Code

You

Change the name to "Campus Roomfit"

ChatGPT

Renamed to Campus Roomfit!

Campus Roomfit

Find your people, one good match at a time.

Download Campus Roomfit.py ↗

I've updated the website title, navigation branding, and Python filename.

All existing features remain, including saved profiles, editing, deleting, and compatibility matching.

Take your curiosity further
Scan to get the ChatGPT app

Your existing `campus_match_profiles.json` file will still work, so you won't lose saved profiles just because of the name change.

Run it with:

```
python3 campus_roomfit.py
```

campus_roomfit.py
Code

NameError: name '__file__' is not defined. Did you mean: '__name__'?

Worked for 1m 3s

ChatGPT

Fixed the `__file__` error!

The problem was that **BlockPy runs Python inside your browser**, where `__file__` doesn't exist.

I've updated Campus Roomfit to work in that environment.

Download Fixed Campus Roomfit.py ↗

Updated Python file with browser-compatible profile storage.

What I changed

- Fixed the `__file__` error.
- Added browser storage for saved profiles.
- Kept the ability to create, edit, and delete profiles.
- Preserved compatibility scoring and the UI.

I verified the Python syntax and tested saving, reloading, and deleting profiles using a simulated environment.

Important about saving profiles

In BlockPy, profiles will be saved using the browser's local storage, when the browser allows it. Profiles may survive closing and reopening the website in the same browser.

If BlockPy blocks that storage, profiles will work during the current session but may disappear after reloading. Drafter normally keeps its State in memory only. Drafter Doc... +1

Take your curiosity further
Scan to get the ChatGPT app

Next step: Replace your old code with the updated file and run it in BlockPy. If another error appears, send me the traceback so we can fix that specific issue.

Worked for 40s

ChatGPT

I've updated **Campus Roomfit** to address both errors.

Campus Roomfit — Repaired Version
Python • 22 KB

Download Campus_Roomfit_Repaired.py ↗

What I fixed

1. `chosen_profile` **error:** Updated the navigation functions so they can accept extra form information without crashing.
2. **Theme error:** Changed the theme setting to `default`, while keeping your custom CSS styling.
3. **Profile deletion:** Kept the confirmation screen and saved-profile deletion logic.

Test it in BlockPy

1. Replace your existing code with the repaired version.
2. Run the program.
3. Open **All Profiles**.

Take your curiosity further
Scan to get the ChatGPT app

4. Select a profile, then choose **Use selected profile**.
5. Click **Delete my profile**, then confirm.

I verified that the updated code passes Python syntax checks. I haven't confirmed the deletion flow in BlockPy's browser environment yet.

Your existing saved profiles should remain available, provided BlockPy is still allowing the same browser storage.

If either error appears again, send me the new message and we'll fix that exact problem.

Campus_Roomfit_Repaired.py
Code

You

The website doesn't open

Worked for 44s

ChatGPT

I've fixed a likely reason **Campus Roomfit wasn't opening in BlockPy**.

Campus Roomfit — Startup Fix
Python file • Syntax checked

Download Campus_Roomfit_Startup_Fix.py ↗

What I changed

- Made sure `start_server(...)` runs directly in BlockPy.
- Removed the theme-switching command that previously caused a syncing warning.
- Kept profile creation, saving, editing, deleting, and matching.

Take your curiosity further
Scan to get the ChatGPT app

Try this

1. Open your BlockPy project.
2. Replace the old Python code with the new file's code.
3. Click **Run**.
4. Check whether the Campus Roomfit home page appears.

The updated file passes a Python syntax check, but I haven't verified its startup inside BlockPy.

If it still doesn't open: Send me the exact error message displayed after clicking Run. That will help me identify the remaining problem without changing unrelated parts of your website.
